

# VistaScan Ultra View

## Simply intelligent and twice as efficient

Intelligent, time-efficient, high-quality – with VistaScan Ultra View, global market leader Dürr Dental has launched a high-end device that can scan all formats of image plate and is specially designed to meet the tough demands of clinics and larger dental practices.

The patented PCS Scan Technology for exceptional image quality even for the finest structures forms the basis of the success story of the VistaScan family. It goes without saying that this technology is also at the heart of the Ultra View system. The UltraView is the only scanner in the world with RFID technology and two slots so that users can scan and digitise two image plates at the same time and therefore save valuable time. The images are displayed with the aid of the Scan Manager on the hygienic, high-resolution 7" touchscreen display, which is made of glass.

In addition, in combination with VistaScan image plates IQ and the imaging software VistaSoft, Ultra View offers a range of helpful, AI-assisted additional functions

Another new AI feature checks the orientation of intraoral X-ray images on the basis of the anatomical features seen in the image and then corrects the orientation if necessary. This step alone would need to be performed manually many times a day otherwise. This is what counts:

- Patented PCS technology for exceptional image quality
- Scan simultaneously using 2 slots and save time
- For all intraoral formats
- High-resolution 7" touchscreen display
- Additional intelligent functions in combination with VistaScan IQ image plates and VistaSoft
